

Step 1

List of local folder to check file size.

Local folders to scan for file sizes

C:\application\logs
C:\application\temp

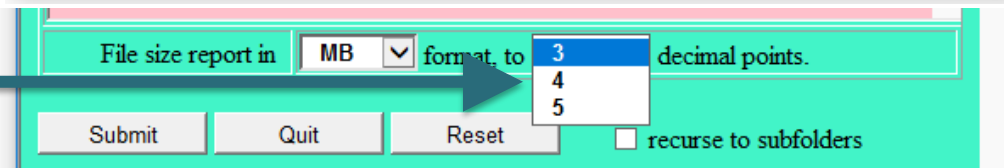

File size report in **MB** format, to 3 decimal points.

Submit Quit Reset ☐ recurse to subfolders

This screenshot shows the first step of the interface. A list box titled 'Local folders to scan for file sizes' contains two entries: 'C:\application\logs' and 'C:\application\temp'. Below the list box, the 'File size report in' dropdown is set to 'MB', and the 'format, to' dropdown is set to '3'. The 'recurse to subfolders' checkbox is currently unchecked.

Step 2

File size format to view.

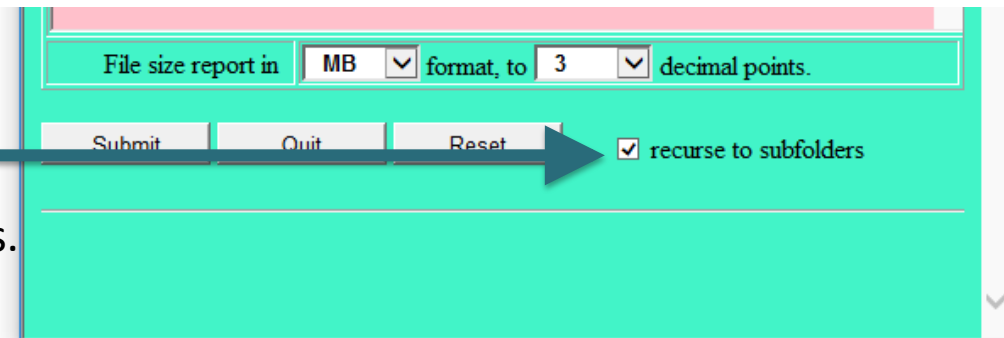

File size report in **MB** format, to 3 decimal points.

Submit Quit Reset ☐ recurse to subfolders

This screenshot shows the second step of the interface. The 'File size report in' dropdown is set to 'MB', and the 'format, to' dropdown is set to '3'. The 'recurse to subfolders' checkbox is currently unchecked.

Step 3

Choose decimal point value.

File size report in **MB** format, to 3 decimal points.

Submit Quit Reset ☒ recurse to subfolders

This screenshot shows the third step of the interface. The 'File size report in' dropdown is set to 'MB', and the 'format, to' dropdown is set to '3'. The 'recurse to subfolders' checkbox is now checked.

Step 4

Run recursive check to all subfolders.

Step 5

Click submit to run script.

Result file will be located at same folder as script run file.

Example of CSV file report layout.

Stop running this script?

A script on this page is causing your web browser to run slowly. If it continues to run, your computer might become unresponsive.

Yes

No

Since this is running over Internet Browser. Long running script will have time-out values. Click no to continue with the script.

Steps below shows how to adjust the time-out values if so desired.

To change this time-out value in Internet Explorer versions 4.0 through 8, follow these steps:

1. Using a Registry Editor such as Regedt32.exe, open this key:

HKEY_CURRENT_USER\Software\Microsoft\Internet Explorer\Styles

Note If the Styles key is not present, create a new key that is called Styles.

2. Create a new DWORD value called "MaxScriptStatements" under this key, and set the value to the desired number of script statements. If you are not sure about which value you need to set this to, you can set it to a DWORD value of 0xFFFFFFFF to avoid the dialog box.

By default, the key does not exist. If the key has not been added, the default threshold limit for the time-out dialog box is 5,000,000 statements for Internet Explorer 4 and later versions.

Because the Internet Explorer versions 4.0 through 8 time-out is based on the number of script statements that are executed, the time-out dialog box does not display during ActiveX control or database-access delays. Endless loops in script will still be detected.
